Table 5: Test Cases (continued)

Test Case	Expected Result	Observed Result
Short-gap prediction	Missing current aircraft may be extrapolated.	Predicted rows are labelled PRED and age-limited.
Prediction recovery	Real data replaces predictions.	Prediction path clears when observations return.
CSV export	Trajectory data can be exported.	Export endpoint writes a CSV and reports row count.
Workbook logging	ICAO files are created when enabled.	Per-aircraft and master workbooks are present.
Dashboard display	Map and details update.	Markers, routes, tabs and altitude chart render.

6.1 Observed Outputs

Output	Workspace snapshot (15 June 2026)
Latest aircraft records in SQLite	15
Trajectory samples in SQLite	649
Daily trajectory CSV files	11
Trajectory export CSV files	1
ICAO workbooks in latest session	15

These counts are a dated workspace snapshot, not aviation-accuracy benchmarks. They may change when the system is run again, when simulation starts a new session, or when retention and export settings are changed.

7. USER INTERFACES

The single-page dashboard contains a status bar, searchable traffic list, central map and resizable detail panel. Live paths are solid, predicted continuations are red and dotted, and PRED labels prevent extrapolated states from being mistaken for current receiver observations.
